

## 12.2 ANGULAR CONTACT BALL BEARINGS

Angular contact ball bearings have raceways of bearing rings designed so that the joins of their contact points and balls contain sharp angle, the so-called contact angle, with the vertical line towards the axis. The bearings are non separable. Separable are some special bearings, or bearings with multipoint contact of QJ type. These bearings are suitable for transfer of combined loads, the so-called simultaneously acting radial and axial loads. With increasing contact angle the axial load bearing capacity grows whilst the radial load bearing capacity slowly reduced.

Dunlop manufacture angular contact ball bearings in many versions and dimensions for use in general engineering. The chart section of the catalogue states the standard assortment of Dunlop bearings with main dimensions and parameters divided as follows:

- Single row angular contact ball bearings
- Single row angular contact ball bearings for high revolution frequency
- Double row angular contact ball bearings
- Four Point Contact Ball Bearings

### Single row angular contact ball bearings

Single row angular contact ball bearings are capable of transferring axial force only in one direction, and are not separable. B and BE design bearings have contact angle  $40^\circ$ . This design allows the bearing to capture radial load acting simultaneously with relatively big axial load in one direction. In order capture axial load in both direction bearings are mounted in pairs opposite each other. BE version bearings have modified inner design in order to transfer bigger load.

The production program includes bearings with contact angle  $25^\circ$  which have additional designation A, alter-natively with  $26^\circ$  identified AA. These bearings are made in P5 and P4 accuracy levels, and are designed for location of machine tool and similar machine spindles with relatively higher axial load.

Fig. 12.2.1

## SINGLE ROW ANGULAR CONTACT BALL BEARINGS FOR HIGH REVOLUTION FREQUENCY

Single row angular contact ball bearings of A70 and A72 type with symmetrical outer ring, or B70 and B72 with symmetrical inner ring are designed for high revolution frequencies. They differ from common bearings of this design group not only in the inner design of bearing raceways but also in the size of the contact angle, design of cage and high accuracy level.

C design bearings have contact angle  $15^\circ$  and are made in the P5, P5A and P4, P4A accuracy classes. They are used mostly for location of spindles of machine tools and similar equipment. CA design bearings have contact angle  $12^\circ$ . CB version bearings have contact angle  $10^\circ$ . They are usually made in the P4 and P4A accuracy level and are designed for very accurate locations with high revolution frequency, e.g. for electric grinding spindles and instruments.

Fig. 12.2.2

---

### Main dimensions

Main dimensions comply with the international standard ISO 15 and are stated in the table section.

### Designation

The system of designating the bearings in basic version forms a part of the data stated in the table section. Difference from the basic design is identified with additional characters as advised in chapter 7.6. The characteristics of individual design variants are described below.

### Cages

The 72 and 73 type bearings in B, BE and A versions are supplied with massive brass cage guided on rolling elements (M). Bearings can be also supplied with a sheet-metal cage that is not identified, or with a massive polyamide cage reinforced by glass fibres (TNG).

Bearings intended for high revolution frequencies are supplied with a massive cage of reinforced fabric – textit – guided on the outer ring (TA), or guided on the inner ring (TB). These bearings can be supplied even with a massive brass cage (M).

## Accuracy

Single row 72 and 73 type angular contact ball bearings are usually made in normal accuracy level P0 whilst this symbol is not presented. For more exacting locations bearings are supplied in higher accuracy level P6 or P5.

Bearings intended for high revolutions are supplied in higher accuracy levels P5 and P4, alternatively P4A

The limit values of bearing dimension and run accuracy deviations comply with the standard ISO 492, and are stated in charts 7.2 and 7.3. Limit tolerance values for bearings of higher accuracies are stated in charts 7.4 to 7.8. Limit tolerance values of installation fillet are stated in chart 7.1. These values comply with the standard IS 82.

## Misalignment

Single row angular contact ball bearings can only balance misalignment to certain limited extent. The allowed misalignment of shaft against the element which does not cause inadmissibly high additional load depends on the service clearance in the bearing, size of bearings, inner design and forces and torques acting on the bearing. Considering unusually complex relations between individual factors, no generally applicable values can be stated. If bearings are mounted in pairs, especially in the arrangement with backs opposite one another (in the “O” layout) with small axial inner clearance, the misalignment can only be compensated by increased load of the balls that will cause higher stress of the cage and reduce the service durability of the bearings. More suitable for locations with small misalignment is the layout of bearings with fronts to each other (in the „X” layout) which has smaller rigidity in tilting. Any misalignment also causes increased noise level during the bearing run.

## Association of bearings

The A70, A72, B70 and B72 version bearings designed for high revolution frequencies are supplied by the manufacturer associated in pairs, triplets or quaternions. Bearing can also be supplied as universally coupled.

Various arrangements of bearings are shown in the figure 12.2.3.

## Associated pair “O”

Pair features high rigidity against misalignment and transfers axial forces in both directions through one bearing only. It is used to capture overturning torque.

## Associated pair “X”

Pair has the same abilities in terms of transfer of axial forces as the “O” arrangement, but lower rigidity in capturing overturning torque.

Fig. 12.2.3

## Associated pair “T”

Pair features high rigidity in capturing overturning torque but is able to transfer axial load in one direction only.

## Association of bearings in triplets and quaternions

For special locations that require high accuracy, rigidity, load bearing capacity and high revolution frequency, bearings of A70, A72, B70 and B72 type are supplied, combined in triplets and quaternions. The scheme of such arrangement is indicated in par. 2.2.

Considering the specifics of such cases, any use of the arrangement in triplets and quaternions should be discussed with the supplier.

Associated pair is supplied in a joint packaging in order to prevent confusion and the place of the biggest radial runout is for the assembly purposes marked with a punch mark on the face of rings. Mutual position of rings opposite each other is marked with concurring lines in “V” shape on the outer cylindrical surface of the associated pair. Bearings are mounted in location so that the punch marks identifying the place of the biggest radial runout are situated on the line that runs in parallel to the shaft axis.

## Universal association of bearings

Bearings for universal pairing are produced in such tolerances that allow in any arrangement achieving of required prestress or tolerance without additional re-grinding of rings, or use of spacing washers. Additional identification of universal bearings contain the U symbol in combination with character that defines the final clearance or prestress range (UA2, UA, UA3, UO, UL, UM, US). Bearings can be arranged in location only in pairs of the same version. Thus, bearings can be mounted in tandems to capture bigger forces where one bearing is not enough; with the fronts or backs opposite each other.

## Internal clearance and prestress

Usual method of use of single row angular contact ball bearings is in a pair where suitable service clearance or prestress are set during the assembly and depends on the construction of location and service conditions.

Dunlop bearings intended for pairing are made for association with three clearance values, without clearance and three prestress values.

- A . . . . . association of bearings with normal clearance
- A2 . . . . . association of bearings with clearance smaller than normal
- A3 . . . . . association of bearings with clearance bigger than normal
- O . . . . . association of bearings without clearance
- L . . . . . association of bearings with small prestress
- M . . . . . association of bearings with medium prestress
- S . . . . . association of bearings with big prestress

## Size of internal clearance and prestress

Indicative values of axial prestress can be determined upon the below relation:

$$F_p = k C_r 10^{-2}$$

where:

$F_p$  . . . . . axial prestress

$k$  . . . . . coefficient of axial prestress according to table 12.2.1

$C_r$  . . . . . radial dynamic load rating

Values of axial clearance of universally pairable bearings in pair with backs or front opposite each other are available in table 12.2.2

Table 12.2.1

Axial prestress		Coefficient K			
Size	Designation	Contact angle $\alpha$			
		10°	12°	15°	26°
		Bearing design			
		CB	CA	C	AA
Small	L	0,4	0,5	0,7	1,2

10	18	5	13	15	23	24	32
18	30	7	15	18	26	32	40
30	50	9	17	22	30	40	48
50	80	11	23	26	38	48	60
80	120	14	26	32	44	55	67
120	180	17	29	35	47	62	74
180	250	21	37	45	61	74	90

## Load rating of bearings mounted in pairs

The load bearing capacity values stated in tables apply to individual bearings. The following values apply to the use in pairs:

Dynamic load rating of pair in O or X arrangement:  $C_{r2} = 1.62 C_{r1}$  (of individual bearing)

Dynamic load rating of pair in T arrangement:  $C_{r2} = 2 C_{r1}$  (of individual bearing)

Static load capacity of pair  $C_{or2} = 2 C_{or1}$  (of individual bearing)

## Equivalent radial dynamic load

### Bearings with contact angle of 40°

Individual bearings:

$$P_r = F_r \quad \text{for } F_a/F_r \leq 1.14$$

$$P_r = 0.35 F_r + 0.57 F_a \quad \text{for } F_a/F_r > 1.14$$

### Bearings with contact angle of 25°

Individual bearings and associated bearings in T arrangement:

$$P_r = F_r \quad \text{for } F_a/F_r \leq 0.68$$

$$P_r = 0.41 F_r + 0.87 F_a \quad \text{for } F_a/F_r > 0.68$$

Associated pairs in O or X arrangement:

$$P_r = F_r + 0.92 F_a \quad \text{for } F_a/F_r \leq 0.68$$

$$P_r = 0.67 F_r + 1.14 F_a \quad \text{for } F_a/F_r > 0.68$$

### Bearings with contact angle of 15°

Individual bearings and associated bearings in T arrangement:

$$P_r = F_r \quad \text{for } F_a/F_r \leq e$$

$$P_r = 0.44 F_r + Y F_a \quad \text{for } F_a/F_r > e$$

Associated pairs in O or X arrangement:

$$P_r = F_r + Y_1 F_a \quad \text{for } F_a/F_r \leq e$$

$$P_r = 0.72 F_r + Y_2 F_a \quad \text{for } F_a/F_r > e$$

$F_r$  and  $F_a$  are forces acting on a pair of bearings. If the shaft is located in two single row angular contact ball bearings, the acting radial clearance will distribute to radial and axial component. Axial load of one bearing depends on the load and size of the contact angle of the second bearing. These additional inner forces must be considered in calculation of bearing.

Table 12.2.3

0,44	0,56	1,12	1,63
0,58	0,56	1,12	1,63

The below table states relations for different arrangements of bearings during acting of external axial force  $K_a$ , radial force  $F_{ra}$  or – more precisely –  $F_{rb}$ . Radial forces act in the point of intersection of joint line with the shaft axis. (Dimension “a” is in the table section.) The calculation considers the force intensity in absolute values only. The calculated force  $F_a$  is instituted in the calculation of equivalent radial dynamic load  $P_r$ .

Fig. 12.2.7

Table 12.2.5

Arrangement of bearings	Force ratios	Axial load of bearings	
		Bearing A	Bearing B
See fig. 12.2.7 and 12.2.8	$F_{rA}/Y_A \leq F_{rB}/Y_B$ $K_a \geq 0$	$F_{aA} = F_{aB} + K_a$	$F_{aB} = e F_{rB}$
	$F_{rA}/Y_A > F_{rB}/Y_B$ $K_a \geq e (F_{rA} - F_{rB})$	$F_{aA} = F_{aB} + K_a$	$F_{aB} = e F_{rB}$
	$F_{rA}/Y_A > F_{rB}/Y_B$ $K_a < e (F_{rA} - F_{rB})^{1)}$	$F_{aA} = e F_{rA}$	$F_{aB} = F_{aA} - K_a$
See fig. 12.2.9 and 12.2.10	$F_{rA}/Y_A \geq F_{rB}/Y_B$ $K_a \geq 0$	$F_{aA} = e F_{rA}$	$F_{aB} = F_{aA} + K_a$
	$F_{rA}/Y_A < F_{rB}/Y_B$ $K_a < e (F_{rB} - F_{rA})$	$F_{aA} = e F_{rA}$	$F_{aB} = F_{aA} + K_a$
	$F_{rA}/Y_A < F_{rB}/Y_B$ $K_a < e (F_{rB} - F_{rA})^{1)}$	$F_{aA} = F_{aB} - K_a$	$F_{aB} = e F_{rB}$

<sup>1)</sup> Applies to  $K_a = 0$   
 For bearings with contact angle  $\alpha = 40^\circ$  (BE a B)  $e = 1,14$ ;  $Y = 0,57$   
 For bearings with contact angle  $\alpha = 25^\circ$  (A)  $e = 0,68$ ;  $Y = 0,87$   
 For other bearings  $e$  and  $Y$  accord. to tables 12.2.3 and 12.2.4

## Equivalent radial static load

The following applies to individual bearings and bearings mounted in tandem:

$$P_{0r} = 0.5 F_r + 0.26 F_a \quad \text{for } P_{0r} \geq F_r$$

$$P_{0r} = F_r \quad \text{for } P_{0r} < F_r$$

The following applies to bearings mounted in O or X arrangement:

$$P_{0r} = F_r + 0.52 F_a \quad \text{for } P_{0r} \geq F_r$$

$$P_{0r} = F_r \quad \text{for } P_{0r} < F_r$$

## Location structure

Designing locations with single row angular contact ball bearings has to consider that these bearings must be used either with another bearing, or in pair. If single row angular contact ball bearings are used, they have to be arranged against each other to achieve the required pre-stress or clearance. If locations use bearings with universal pairing in contact next to each other, they need not be adjusted. Required prestress or clearance will be achieved by selecting a bearing of corresponding pre-stress or clearance class and proper location on the shaft and in the body.

Proper adjustment and selection of pre-stress or clearance are essential for correct function of the bearing and reliability of location. If the service clearance is e.g. too big, then the bearing's load bearing capacity will not be fully utilised, whilst excessive pre-stress will cause high friction and higher service temperature which will lead to shorter service durability of the bearing. It however has to be emphasized that proper rolling of single row ball bearings of 72B and 73B series (with contact angle 40°) is only ensured in case that  $F_a/F_r \geq 1$ .

Special attention has to be paid to a pair of bearings mounted with their backs opposite each other (in the "O" arrangement), or with their fronts opposite each other (in the "X" arrangement), when axial load prevails in one direction. Incorrect rolling of unloaded bearing balls in these conditions might cause noise, interruption of grease film and increased stress of the cage. Under such conditions it is advisable to have zero service clearance which can be achieved e.g. by the use of thrust springs, or by pairing of bearings with adequate pre-stress sizes.

Single row angular contact ball bearings d = 10 to 240 mm

d = 10 to 45 mm

## DOUBLE ROW ANGULAR CONTACT BALL BEARINGS

### Design

Double row angular contact ball bearings in fact correspond with associated pair of single row angular con-tact ball bearings in configuration "O". At the same size (d and D), associated pair has total width smaller.

They can transfer radial load and also double direction axial loads. Bearings allow design of rigid location and transfer also overturning torques. Standard offer of Dunlop double row angular contact ball bearings (fig. 12.2.4) includes:

- Bearings in standard version
- Bearings with seals

Fig. 12.2.4

---

### Bearings in standard version

Dunlop double row angular contact ball bearings in fact of 32 and 33 series produced in the NEW FORCE stan-dard are marked with \*\* in the table section. The bearings feature optimised inner design. They have a filling slot on one side. If axial forces acting in one direction prevail, the bearing should be mounted so that these forces do not act against the filling slot.

The bearings have contact angle of  $32^\circ$ . Due to this design they are able to transfer axial load and higher overturning torques in axial plane so if there is a lack of space, only one bearing is enough for location of the rotary part.

## Bearings with seals

The bearings have a design with contact angle of 25°. The 32 and 33 series bearings with sealing 2RS are filled with high quality lithium grease Shell Gadus F2V100-3. This grease features good anticorrosive properties, and can be therefore used in temperature ranging between -30 and 20 °C. The viscosity of basic oil compound is 100 mm<sup>2</sup>/s at 40 °C or 10. mm<sup>2</sup>/s at 100 °C.

## Main dimensions

The main dimensions of the bearings comply with the ISO 15 standard, with the exception of the width of bearing 3200X. Dimensions of individual bearings are stated in the table section of the publication.

## Designation

The system of designating the bearings in basic version is stated in the table section of the publication. Difference from the basic design is identified with additional characters as advised in chapter 7.6.

## Cages

Double row angular contact ball bearings have cages pressed of steel plate (fig. 12.2.5). The design not identified. Bearings can be also supplied with polyamide cage PA6 or PA66, designated TNG (fig. 12.2.6)

Fig. 12.2.5

Fig. 12.2.6

## Accuracy

Bearings are usually made in normal accuracy level P0 whilst this symbol is not presented. For more exacting locations bearings in higher accuracy level P6 are made.

The limit values of bearing dimension and run accuracy are stated in charts 7.2 to 7.4, and comply with the standard ISO 492.

## Axial clearance

Commonly produced bearings feature normal axial clearance that is not identified. Special locations require bearings with reduced C2 and increased axial clearance C3 and C4. Axial clearance values are stated in chart 7.17b.

## Misalignment

Bearings form very rigid locations and are extremely sensitive to misalignment of rings caused by assembly inaccuracies. Any misalignment of bearing rings in operation will also increase significantly the noise level and shorten the service life of the bearing.

## Minimum load

Bearings with point or line contact must be exposed to certain minimum load in order to ensure their proper operation. This applies also to double row ball bearings working at high revolutions where high acceleration or sudden changes of acting load occur. Under such conditions the inertial forces of balls and cages as well as the friction in the lubricant may have negative impact on the conditions of rolling, which might cause damage to the rolling elements and raceways due to slipping. The required minimum radial load for double row angular contact ball bearings can be estimated by the below relation:

$$F_{rm} = k_r \cdot \left( \frac{vn}{1000} \right)^{\frac{2}{3}} \cdot \left( \frac{d_m}{100} \right)^2$$

$F_{rm}$  . . . . . is minimum radial load [kN]

$k_r$  . . . . . is coefficient of minimum radial load

. . . . . 0.06 for bearings of series 32

. . . . . 0.07 for bearings of series 33

$v$  . . . . . oil viscosity at service temperature [mm<sup>2</sup>/s]

$n$  . . . . . revolutions [min<sup>-1</sup>]

$d_m$  . . . . . mean diameter of bearing, i.e. 0.5 (d + D), [mm]

At start-up in low temperatures, or in use of grease with high viscosity even higher minimum load may be necessary. The weight of components captured by bearing, along with external forces is often higher than the minimum load required. If this is not the case, an additional radial load must act on double row angular contact ball bearing.

### Equivalent radial dynamic load

$$P_r = F_r + 0.73F_a \quad \text{for } F_a / F_r \leq 0.86$$

$$P_r = 0.62F_r + 1.17F_a \quad \text{for } F_a / F_r > 0.86$$

### Equivalent radial static load

$$P_{or} = F_r + 0.63F_a$$

### Double row angular contact ball bearings d = 10 to 110 mm

d = 10 to 70 mm

## 12.3 DOUBLE ROW SELF ALIGNING BALL BEARINGS

---

### Design

Bearings are designed with two rows of balls and round raceway on the outer ring, which enables certain tilting of the inner ring towards the outer ring around the bearing centre without impeding bearing function (fig. 12.3.1). Bearings are made with a cylindrical (a) or tapered (b) bore and are non-detachable. The self-aligning ability, while maintaining functionality, determines the bearing application in cases, where certain misalignment of bores in the bearing hubs or deflection and oscillation of the shaft are expected. Due to the small contact angle and imperfect adherence of the balls to the raceways, they are unsuitable for capturing greater axial forces.

Fig. 12.3.1a

Fig. 12.3.1b

---

Due to the small adherence of balls on the outer ring spherical surface, self-aligning ball bearings elicit little friction in comparison to other types of bearings and the heat generated is thus also less. The Dunlop product line includes only standard uncovered bearings.

### Standard design

Dunlop double row self-aligning ball bearings, manufactured to NEW FORCE standards, are designated as \*\* in the tables. Standard self-aligning ball bearings are designed with a cylindrical bore. They are also alternatively
